☐ Please call about this case prior to fabrication.
☐ Enroll this case in Appliance Protection (Additional fee).
☐ Please make this design a MyWay™ (Representative will call).
☐ MyWay™ # ☐☐☐

IMPORTANT : All functional appliances REQUIRE a bite registration taken in the final desired position, unless otherwise noted.

Bionator I
☐ Without midline screw

Designed for use in Class II skeletal cases that require bite opening. Although a midline screw is included, best results are achieved when some maxillary widening has been accomplished prior to its use and where crowding is minimal. Please include opposing models and a bite registration with edge-to-edge A/P relation and a 2-3mm anterior opening.

Bionator II
☐

Modified to accommodate Class II cases requiring bite closure. Acrylic blocks in the posterior hold while the anterior is allowed to erupt. Please include opposing models and a bite registration with edge-to-edge A/P relation and a 2-3mm posterior opening.

Bionator to Maintain
☐

Provides Class II correction while maintaining a proper overbite. Posterior acrylic and incisal capping balance the arch. Please include opposing models and a bite registration with edge-to-edge A/P relation and a 2-3mm posterior opening.

Correctors
☐ I ☐ II ☐ To Maintain

Correctors are the same as Bionators except that two side screws are added to allow future anterior positioning of the mandible. Please include opposing models and a bite registration in a comfortable, not fully end-to-end position.

Rick-A-Nator
☐

A 45-degree bite plane is attached to a Fixed Lingual Arch for stability. It is important that all upper expansion be completed prior to use of the Rick-A-Nator for maximum correction.

Twin Block™
☐

The Twin Block™ is a two-part appliance that contains occlusal ramps to guide the mandible to the anterior when in a closed position. Expansion screws, finger springs, and a labial bow may be added as needed. The bite registration should be taken with the mandible advanced to the desired position and 2-3mm opening in the posterior.

LSU Activator
☐

The most secure retention of all activators. Bands with headgear tubes should be placed on the molars to act as positive locks for the ball end 'C' clasps of the activator. Careful trimming during treatment will guide erupting teeth into the proper position.

Frankel I
☐

The Frankel appliance, developed by Dr. Rolf Frankel of Germany, works within the vestibule of the mouth. It holds the tissue of the lips and chin away from the teeth, allowing the skeletal system to develop naturally. The Frankel I is best suited for cases with minimal crowding.

Frankel II
☐

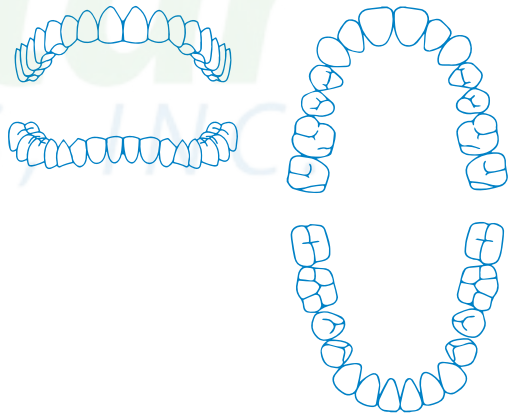
The Frankel II appliance is similar to the Frankel I with modifications to accommodate Class II, division 2 cases and Class I cases with more extensive crowding.

Frankel III
☐

The Frankel III appliance is designed for the Class III patient. Besides stimulating arch development, patient acceptance is high since the patient's profile is immediately improved with wear due to the bean-shaped upper pads which give a fuller appearance to the lip.

Design your Own / Special Instructions
☐ U ☐ L

Please draw and describe the appliance you desire.
Include a suitable bite registration.



Lab Use Only: BBP? ☐
